Greinargerð MÓ-94-06

## KALT VATN Á RANGÁRVÖLLUM

### Efnasamsetning vatns á nokkrum stöðum

Pann 12. janúar 1994 tók undirritaður starfsmaður Orkustofnunar sýni af köldu vatni á 10 stöðum á Rangárvöllum. Sýnataka þessi fór fram að beiðni Ómars Bjarka Smárasonar (Stapi - Jarðfræðistofa) og er liður í rannsókn á grunnvatni á neðanverðum Rangárvöllum í tengslum við hugsanlegan sorpurðunarstað við Strönd. Fjögur sýnanna voru svokölluð heilsýni þar sem öll aðalefni eru greind auk margra snefilefna, en á sex stöðum var einungis mælt sýrustig og karbónat. Samhliða sýnatöku tók starfsmaður frá Stapa - Jarðfræðistofu sýni til gerlamælinga, mælinga á lífrænum eftum, mældi leiðni o. fl.

Sýni voru tekin á eftirtoldum stöðum:

Staður	Lýsing	Gerð sýnis	Númer
Strönd hola 1	dæling	heilsýni	94-9005
Strönd hola 2	dæling	heilsýni	94-9003
Lambhagi	mjólkurhús	heilsýni	94-9004
Langekra	gamalt mjólkurhús	heilsýni	94-9006
Hjarðarbrekka I	eldhús	hlutsýni	94-9010
Hjarðarbrekka II	eldhús	hlutsýni	94-9011
Oddi	gestasalerni	hlutsýni	94-9008
Vindás	þvottahús	hlutsýni	94-9009
Sólvellir	eldhús	hlutsýni	94-9007
Selalækur II	þvottahús	hlutsýni	94-9012

Í meðfylgjandi töflu eru greint frá niðurstöðum allra mælinga sem gerðar voru á Orkustofnun. Meðhöndlun sýna við sýnatöku, efnagreiningaraðferðum og greiningarmörkum er lýst á meðfylgjandi fylgiplaggi, dagsett 21.12.1993. Einnig fylgir með tafla sem sýnir viðmiðunarmörk fyrir drykkjarvatn.

Hér verður ekki farið út í starlega túlkun á niðurstöðum efnagreininganna, en þó bent á nokkur áhugaverð atriði. Í fyrstu er rétt að taka eftir þeim mun sem kemur fram á efnasamsetningu vatns úr holum 1 og 2 annars vegar og frá t.d. Lambhaga og Langekru hins vegar. Styrkur allra aðalefna mælist umtalsvert hærri í Lambhaga og Langekru en í vatni úr holunum. Sýrustig mælist hærra í vatni úr holunum. Allt þetta bendir til einhverskonar umhverfismengunar t.d. frá áburði. Styrkur járnars mælist hærri í vatni úr holunum sem gæti stafað af háum járnstyrk í glerkenndum sandinum sem holurnar skera. Aftur á móti er trúlegt að hærri styrkur sínks í Langekru en á hinu stöðunum geti stafað frá uppleysingu á galvanhúð í vatnslögn.

Einnig er rétt að benda á lágt sýrustig á nokkrum stöðum, einkum í Odda, en lágt sýrustig bendir til að vatnið sé mengað af yfirborðsvatni. Lágt sýrustig veldur því einnig að vatnið er tærandi fyrir járnlagnir.

Tafla. Efnaðsamsetning vatns (mg/l)

### Parameters measured in water samples

Samples for measurement of pH, total sulphide and total carbonate are collected in a gas collection bulb and analyzed at room temperature within 24 hours.

Gas samples are collected in a gas collection bulb and analysed by gas chromatography.

Parameter	Method	Detection Limit in mg/l
pH	is measured by a pH-meter with a glass electrode	
Total sulphide as H <sub>2</sub> S	is measured by titration with 0.001 M mercuric acetate with dithizone as indicator	0.02
Total carbonate as CO <sub>2</sub>	is measured by titration with 0.1N HCl using a pH-meter	1.0
Conductivity	is measured with a conductivity meter	-
Total dissolved solids	is determined gravimetrically after drying at 180°C and 260°C	2.5
Sodium (Na)	is measured by atomic emission spectrophotometry of a filtered and acidified sample	0.001
Potassium (K)	is measured by atomic emission spectrophotometry of a filtered and acidified sample	0.001
Calcium (Ca)	is measured by atomic absorption spectrophotometry in a graphite furnace of a filtered and acidified sample	0.001
Magnesium (Mg)	is measured by atomic absorption spectrophotometry in a graphite furnace of a filtered and acidified sample	0.0001
Silica (SiO <sub>2</sub> )	is measured spectrophotometrically as (yellow) silicomolybdate complex in a sample of raw water	0.5
Barium (Ba)	is measured by atomic absorption spectrophotometry in a graphite furnace in a filtered and acidified sample	0.005
Iron (Fe)	is measured by atomic absorption spectrophotometry in a graphite furnace in a filtered and acidified sample	0.0001
Manganese (Mn)	is measured by atomic absorption spectrophotometry in a graphite furnace in a filtered and acidified sample	0.0001
Aluminium (Al)	is measured by atomic absorption spectrophotometry in a graphite furnace in a filtered and acidified sample	0.001
Antimony (Sb)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace or by hydride generation	0.002
Molybdenum (Mo)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.002
Arsenic (As)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry by hydride generation	0.001
Selenium (Se)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry by hydride generation	0.004
Chromium (Cr)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.0001
Copper (Cu)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.0001

Parameter	Method	Detection Limit in mg/l
Lead (Pb)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.0005
Nickel (Ni)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.001
Zinc (Zn)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.0001
Lithium (Li)	is measured in a filtered and acidified sample by atomic emission spectrophotometry	0.0005
Strontium (Sr)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.0001
Cobalt (Co)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.0002
Cadmium (Cd)	is measured in a filtered and acidified sample by atomic absorption spectrophotometry in a graphite furnace	0.00005
Mercury (Hg)	is collected into KMnO <sub>4</sub> solution and measured by amalgamation flameless atomic absorption spectrophotometry	0.000002
Chloride (Cl)	is measured by ion chromatography of a filtered sample	0.025
Sulphate (SO <sub>4</sub> )	is measured by ion chromatography of a filtered sample	0.020
Fluoride (F)	is measured by ion chromatography of a filtered sample	0.002
Iodide (I)	is measured by ion chromatography of a filtered sample	0.0002
Cyanide (CN)	is measured by ion chromatography of a filtered sample	0.002
Bromide (Br)	is measured by ion chromatography in a filtered sample	0.005
Nitrite (NO <sub>2</sub> )	in a raw sample is measured by an azodyecolorimetric method in autoanalyser	0.005
Nitrate (NO <sub>3</sub> )	in a raw sample is transformed to nitrite by Cu-Cd reduction and analyzed by an azodyecolorometric method in autoanalyser	0.005
Ammonium (NH <sub>3</sub> )	is measured in a raw sample by indophenolblue in autoanalyser	0.001
Boron (B)	is complexed with azomethine-H and measured spectrophotometrically in a filtered sample	0.005
Phosphate (PO <sub>4</sub> )	is measured by an automated ascorbic acid reduction method in autoanalyser	0.002

Description of the analytical methods for most elements are found in:

Methos for Chemical Analysis of Water and Wastewater, EPA/600/4-79/020, March 1983.  
and

Standard Methods. For the Examination of Water and Wastewater, American Public Health Association, Washington, DC 20005, 1134.

The method for boron analysis is described in: Chemical Analysis and Sampling Techniques for geothermal Fluids and gases at the Fenton Hill Laboratory. Los Alamos National Laboratory, La-11006-MS, UC-66b, June 1987, 83pp.
