Skrá yfir skýrslur og greinar, sem varða aurburð	" 5
Skrá yfir sýnatökustaði	" 7
Fjöldi aursýna eftir tegundum og árum	" 12
Aurburðartöflur og skýringar á þeim	" 13

INNGANGUR

Rekja má upphaf aurburðarrannsóknna til ársins 1881, er norsk jarðfræðingurinn Amund Helland var hér við mælingar, m. a. áætlaði hann rof undir Vatnajökli. Næstu 60 árin lágu slíkar rannsóknir svo að mestu niðri. Þráðurinn var síðan tekinn upp að nýju 1949 af Vatnamælingum Raforkumálastjóra. Á árunum 1949-1962 var safnað og unnið úr á sjötta hundrað aurburðarsýna frá rúmlega sjötíu stöðum á landinu. (Sjá Haukur Tómasson, Svanur Pálsson, Sigurjón Rist & Guðmundur Vigfússon: "Skýrsla um aurburðarrannsóknir fram til 1970". 2. hefti).

Tímamót verða hins vegar árið 1963 með stofnun sérstakrar aurburðarrannsóknastofu í Keldnaholti á vegum Raforkumálastjóra, síðar Orkustofnunar. Þá voru tekin í notkun tæki til að mæla kornastærðardreifingu einstakra svifaurssýna, en áður var aðeins unnt að mæla heildarmagn svifauris í einstökum sýnum. Í janúar 1981 fluttust aurburðarmælingarnar frá Keldnaholti í húsnæði Orkustofnunar að Grensásvegi 9. Síðan Aurburðarstofa var sett á laggirnar 1963, hafa verið mæld á sjötta þúsund aurburðarsýni, sjá töflu á bls. 12. Skýringar á táknum fyrir tegundir sýna eru gefnar í "Skýringum á Aurburðartöflum" bls. 14-16. Mest áhersla hefur verið lögð á að taka sýni úr þeim jökulám, sem líklegt er, að verði virkjaðar, en auk þess hefur verið tekið úr nokkrum öðrum jökulám, einkum þeim, sem bera fram mikinn aur. Er þá sérstaklega um að ræða ár, sem koma undan Mýrdalsjökli og sunnanverðum Vatnajökli. Sýni hafa einnig, einkum allra seinustu árin, verið tekin úr allmörgum bergvatnsám, en örfá úr hverri, til að fá einhverja hugmynd um svifaur í þeim við mismunandi aðstæður.

Auk þess að gefa mikilsverðar almennar upplýsingar um rof landsins, hefur aurburður áhrif á virkjanleika vatnsfalla. Virkjunum fylgja að jafnaði miðlunar- og inntakslón. Þegar hægir á jökulánum í slíkum uppistöðum, fellur aurinn út, og getur hann smám saman fyllt slík lón og gert þau óhæf til miðlunar á vatni. Í stórum miðlunarlónum eru þetta langtímaáhrif, því að þau taka flest lengi við án þess að verulegrar rýrnunar á miðlunarrými verði vart. Aftur á móti eru þessi áhrif fljót að koma í ljós í litlum inntakslónum, eins og dæmi sanna hérlendis. Þannig er Bjarnalóni við Búrfell haldið við með sanddælingu.

Skilagrein þessi er skrá yfir sýnatökustaði, töflur með niðurstöðum þeirra aurburðarmælinga, sem gerðar hafa verið á Aurburðarstofu Orkustofnunar síðan 1963, og skrá yfir skýrslur og greinar, sem varða aurburð. Áður hafa verið birtar niðurstöður aurburðarmælinga til ársloka 1970. (Sjá Haukur Tómasson, Svanur Pálsson, Sigurjón Rist & Guðmundur Vigfússon: "Skýrsla um aurburðarrannsóknir fram til 1970". 1. hefti). Niðurstöður þessara mælinga eru undirstaða frekari úrvinnslu um aurburð. Aurburður vatnsfalla er háður ýmsum þáttum og getur verið erfitt að henda reiður á suma

þeirra. Þó blasir við, að hann er eitthvert fall af rennsli, og einnig að þetta fall er annað á veturnum en sumrum. Þetta fall er kallað aurburðarlykill og er notað til að reikna heildaraurburð viðkomandi ár út frá meðalrennsli hvers sólarhrings.

Til þess að skilgreina aurburðarlykil þarf mörg sýni svo að fjölbreytilegar aðstæður við árnar komi fram. Oft þarf því mörg ár til þess að ná nógu mörgum sýnum til ákvörðunar á góðum lykli. Breytingar á vatnasviði einhverrar ár, annaðhvort af manna völdum eða náttúrunnar gera nauðsynlegt að reikna marga aurburðarlykla fyrir sömu á. Með samanburði aurburðarlyklanna fæst sú breyting, sem orðið hefur, hvort sem er milli árstíða eða til lengri tíma litið.
