Inngangur

Skýrsla þessi birtir gögn frá vatnshæðarmælum í þremur borholum í Heiðmörk, vhm 187, 188 og 189 frá upphafi rekstrar þeirra í nóvember 1972 til ársloka 1994. Gögnin eru góð, frávik frá réttri vatnshæð fátítt og þá vart meira en 3 - 5 cm. Lítið hefur þurft að áætla vegna bilunar í mælunum. Vhm 188 brást í nóvember og desember 1993 en þá mældist hæsta vatnshæð á svæðinu frá upphafi mælinga. Það hámark er því áætlað fyrir þann mæli.

Á myndum 1 - 3 er sýnd meðalvatnshæð í holunum á árunum 1973 - 1994.

Á myndum 4 -6 er sýnd vatnshæð í holunum kl. 24.00 á árunum 1972 - 1994.

Á mynd 7 eru sýnd meðaltöl og útgildi.

Þá eru hér birtar litmyndir af vatnshæðarferlum holanna á ársgrunni. Á hverri mynd er ársferill fyrir holurnar þrjár ásamt rennsli Hólmsár og veðurgögnum frá Reykjavík til samanburðar. Hæðarkvarðar eru þeir sömu á öllum myndunum. Rennsliskvarðinn fyrir línuritið af Hólmsá nær frá 0 - 25 m³/s. Í þau skifti sem rennslið verður meira skerst af línuritinu.

Að lokum eru lagðar með vatnshæðarskýrslur fyrir vhm 187, 188, 189 frá árunum 1972 - 1994.
